# Tutorial: Data-Driven Approaches towards Malicious Behavior Modeling

Meng Jiang  
University of Notre Dame

Srijan Kumar  
Stanford University

Christos Faloutsos  
Carnegie Mellon University

V.S. Subrahmanian  
University of Maryland, College Park

Tutorial link: <http://bit.ly/kdd2017>

# Outline

## Introduction

Feature-based algorithms

Bots

Sockpuppets

Vandals

Hoaxes

Spectral-based algorithms

Visualization: “spokes”, “blocks”, “staircases”

Camouflage

Theoretical guarantee

Density-based algorithms

Ill-gotten Likes

Synchronized Behaviors

Advertising campaigns

Social spam

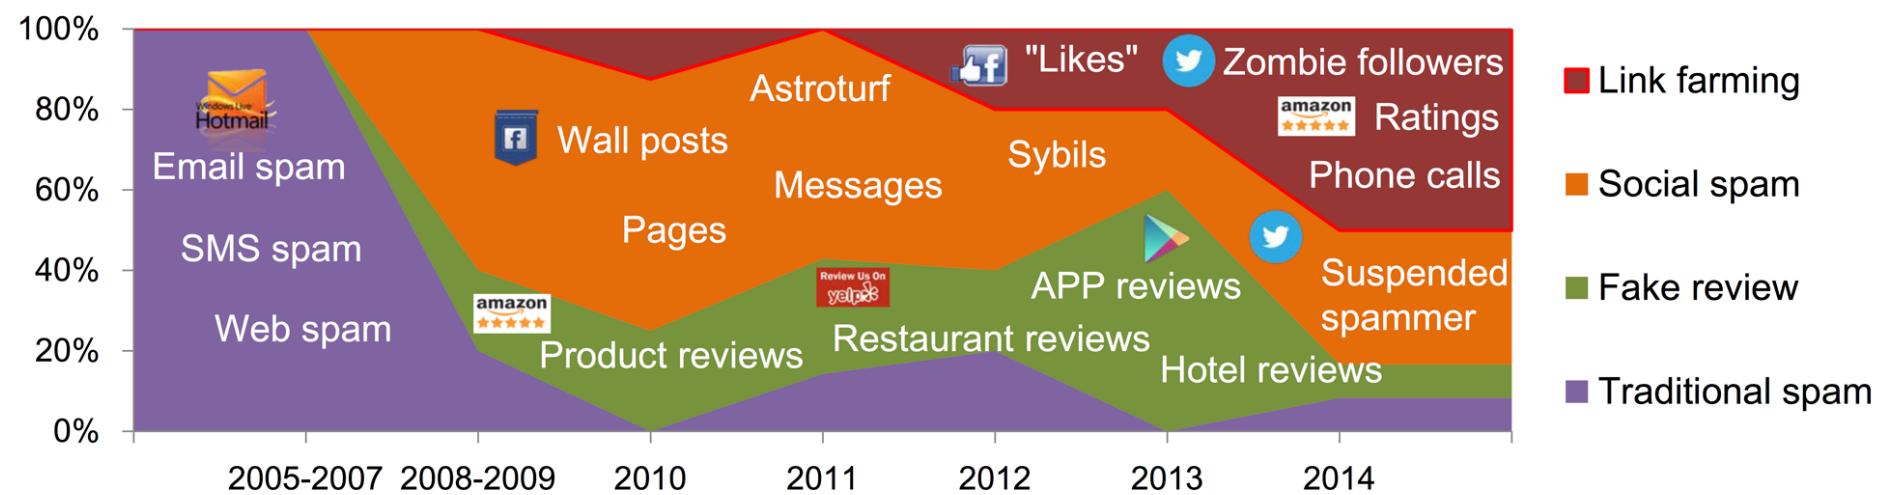

Conclusions and future directions

Tutorial link: <http://bit.ly/kdd2017>

# Suspiciousness and Density

- What is worth of inspections in our data?
- Suspiciousness: tending to cause or excite suspicion
  - Unexpected high density
  - ...
- Suspicious **density** of user behaviors in applications
  - Ill-gotten Likes: Facebook, etc.
  - Zombie followers: Twitter, Weibo, etc.
  - Social spam/fake reviews: Twitter, Weibo, Amazon, etc.
  - Advertising campaigns: Twitter, Weibo, etc.

# ... Social Spam, Social Link Farming

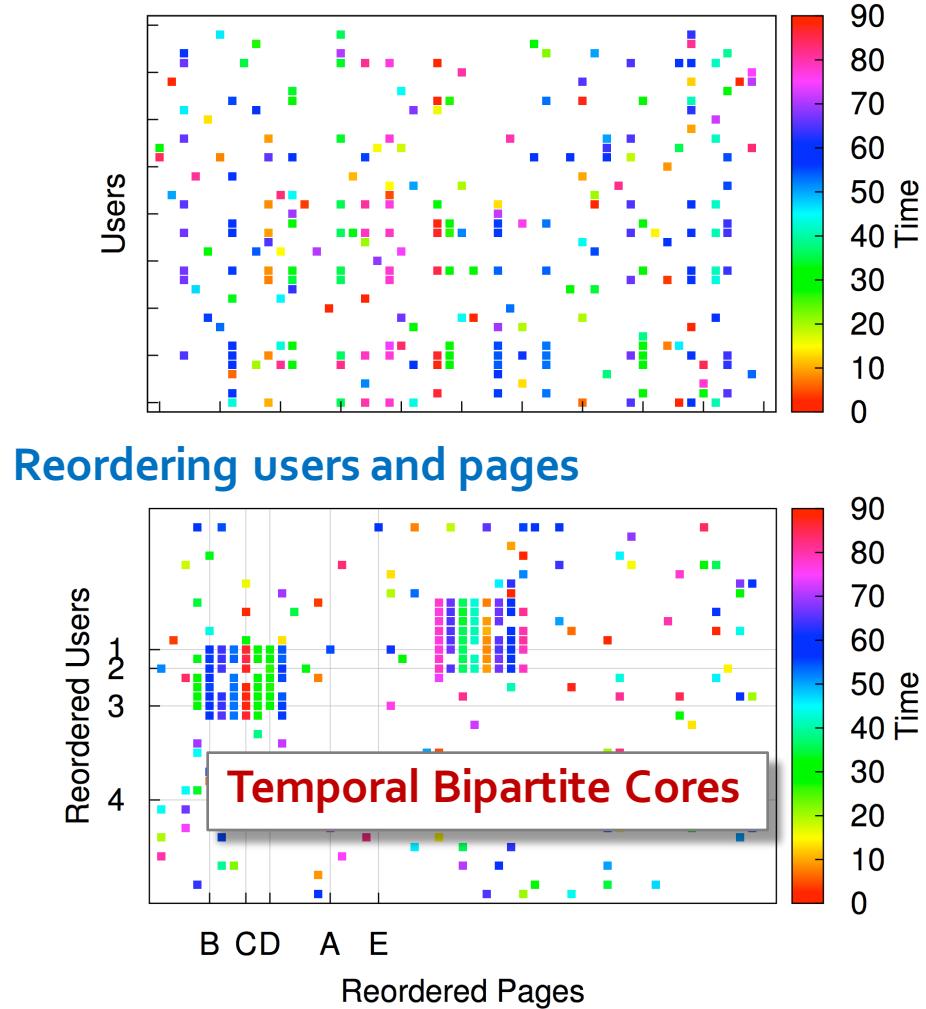

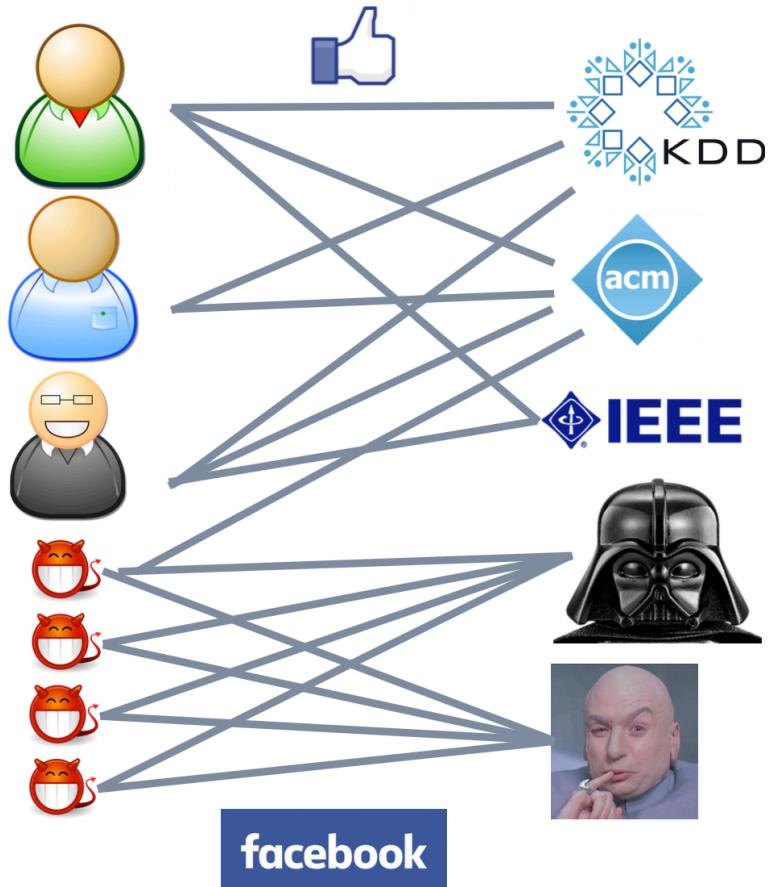

Meng Jiang, Peng Cui, and Christos Faloutsos. "Suspicious behavior detection: current trends and future directions." **IEEE Intelligent Systems**, 2016. (Survey paper)

# 1. Ill-gotten Facebook Likes

Power-law distributions in networks

# Spikes!

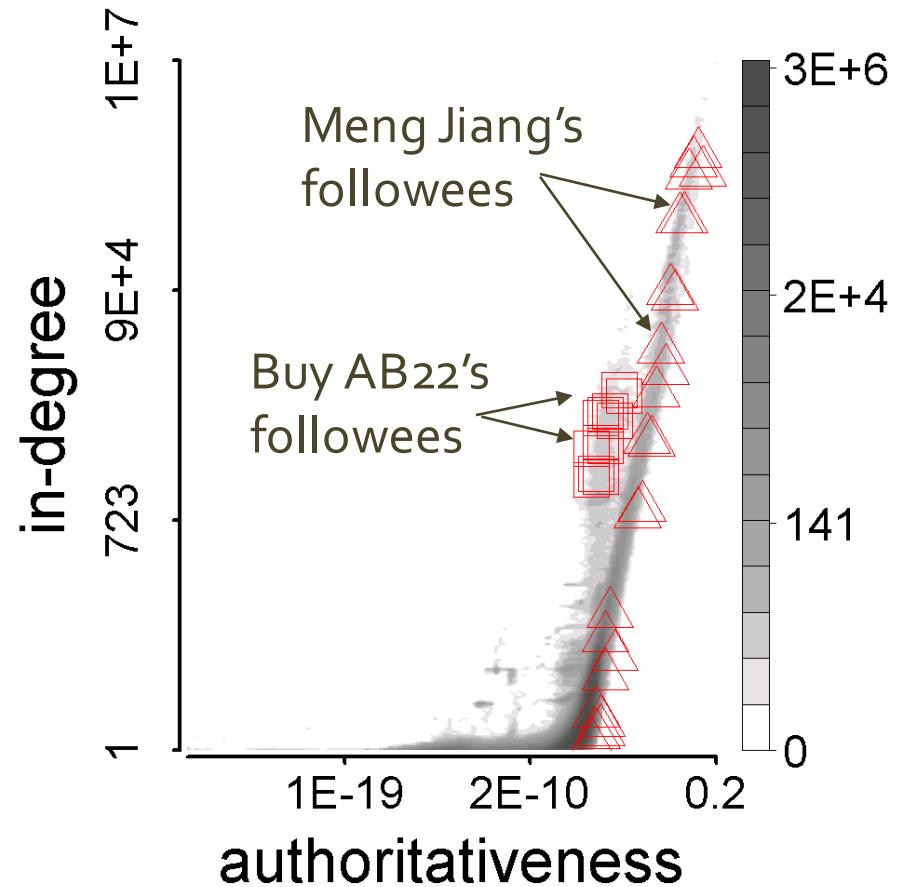

# How We/They Connect to Our/Their Followees

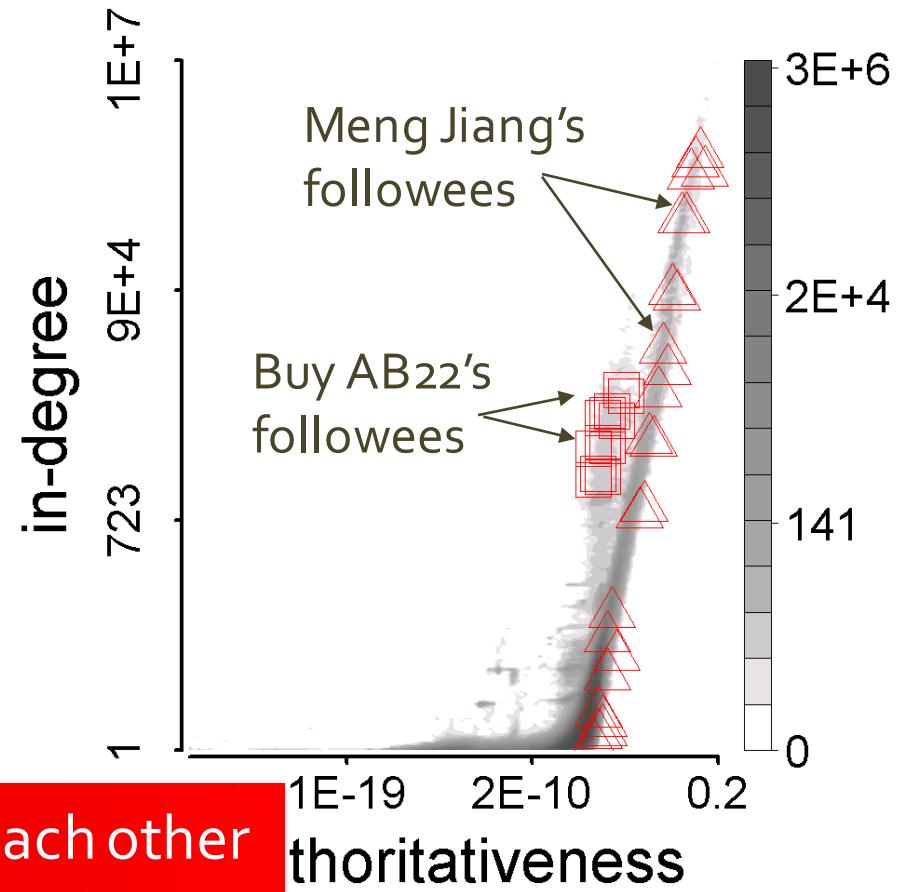

The HITS algorithm. Kleinberg. “Authoritative sources in a hyperlinked environment.” JACM’99.

# How We/They Connect to Our/Their Followees

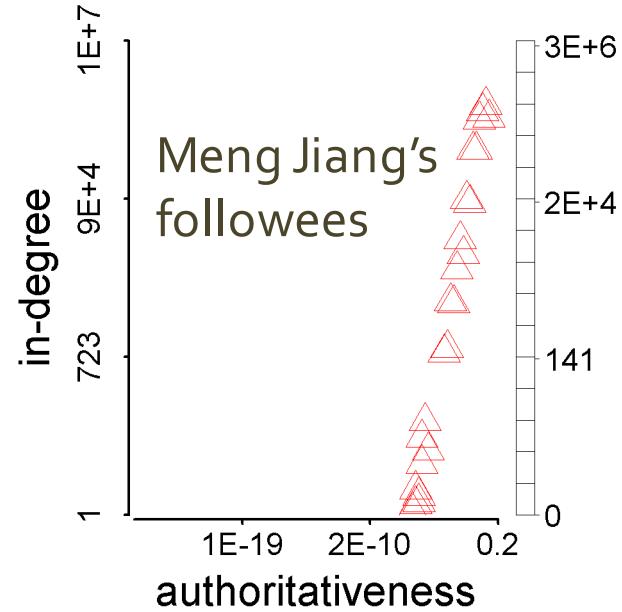

# How We/They Connect to Our/Their Followees

Synchronized: too similar with each other  
Abnormal: too different from the majority

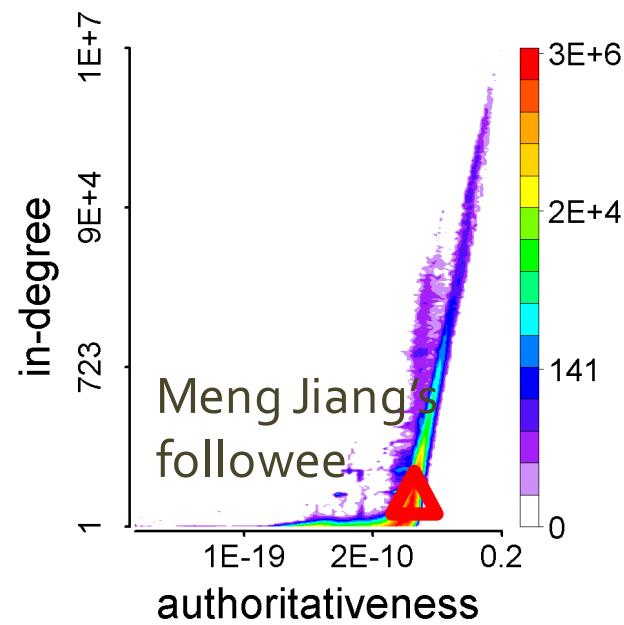

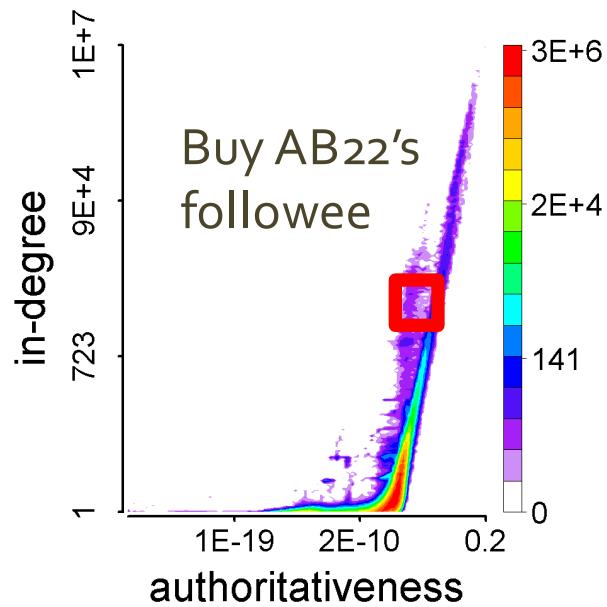

# Definition: Synchronicity

$$sync(u) = \frac{\sum_{(v, v') \in \mathcal{F}(u) \times \mathcal{F}(u)} \mathbf{p}(v) \cdot \mathbf{p}(v')}{d(u) \times d(u)}$$

# Definition: Normality

$$norm(u) = \frac{\sum_{(v,v') \in \mathcal{F}(u) \times \mathcal{U}} \mathbf{p}(v) \cdot \mathbf{p}(v')}{d(u) \times N}$$

# When is the Synchronicity Too High?

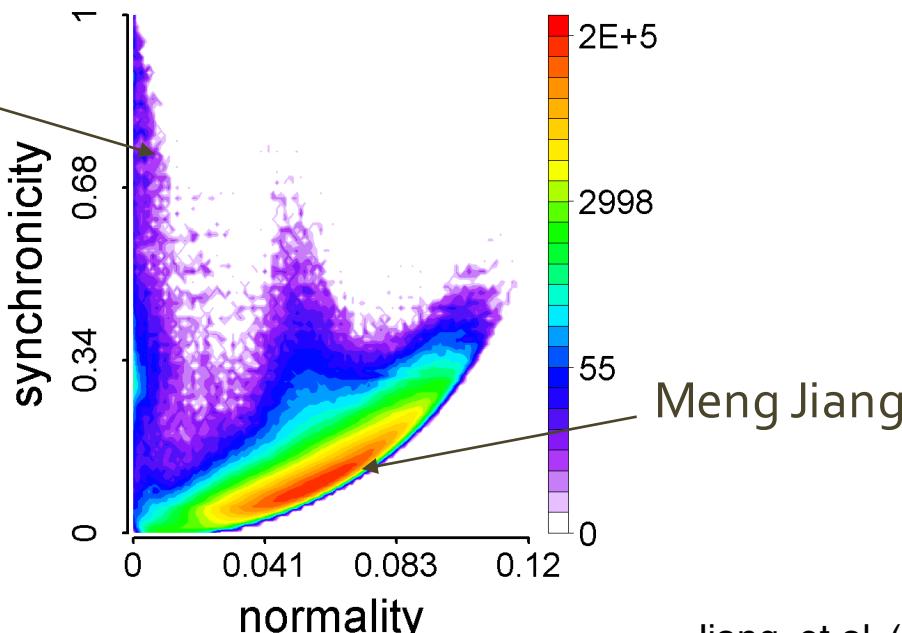

**Problem:** Given a normality value ( $n$ ) of a follower, find the minimal synchronicity value ( $s_{\min}$ ).

**Theorem:**

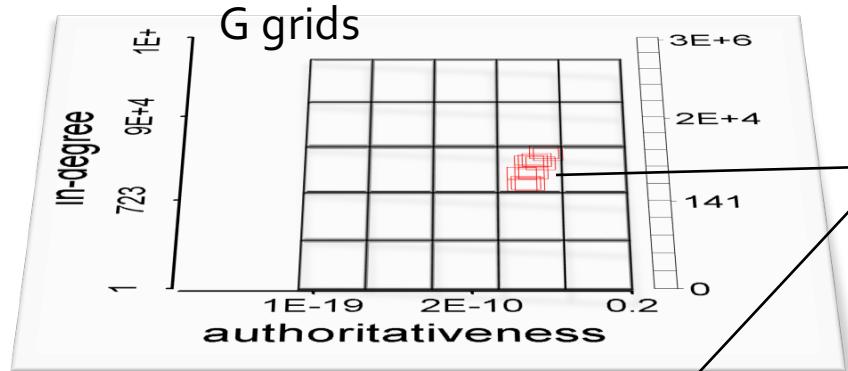

$$s_{\min} = \frac{-G n^2 + 2 n - s_b}{1 - G s_b} \quad (\text{parabolic lower limit})$$

**Our CatchSync:**

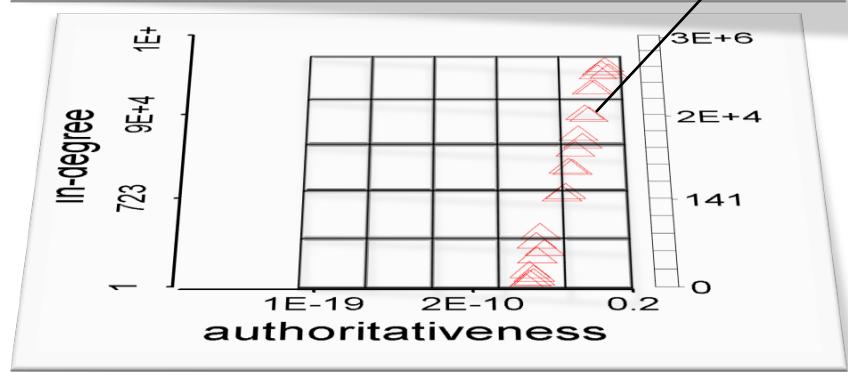

Buy AB22 &  
Aisling Walsh

# Proof

$fp_g$ : #foreground points in grid g  
 $\sum fp_g = F = d(u)$  (#followees of u)

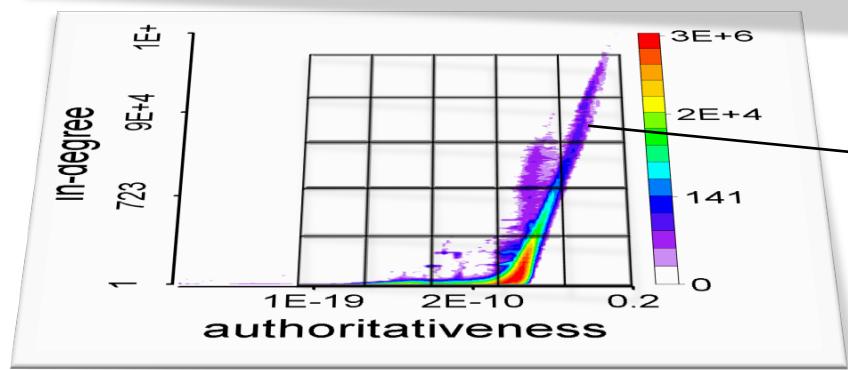

Given normality

$n = \sum (fp_g/F) (bp_g/B) = \sum f_g b_g$ ,  
 find minimal synchronicity

$$s_{\min} = \sum (fp_g/F) (fp_g/F) = \sum f_g^2$$

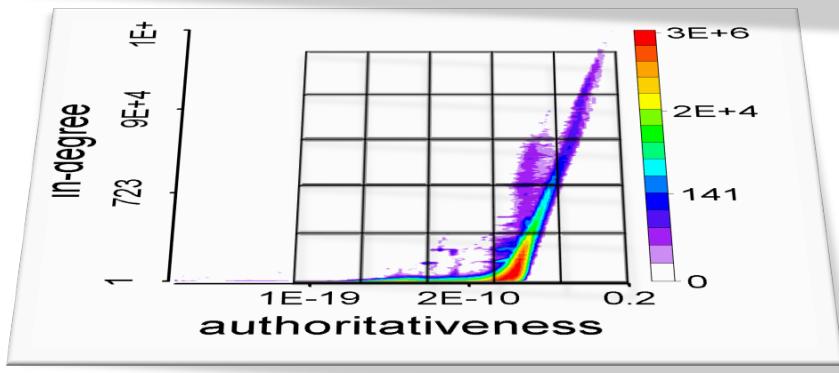

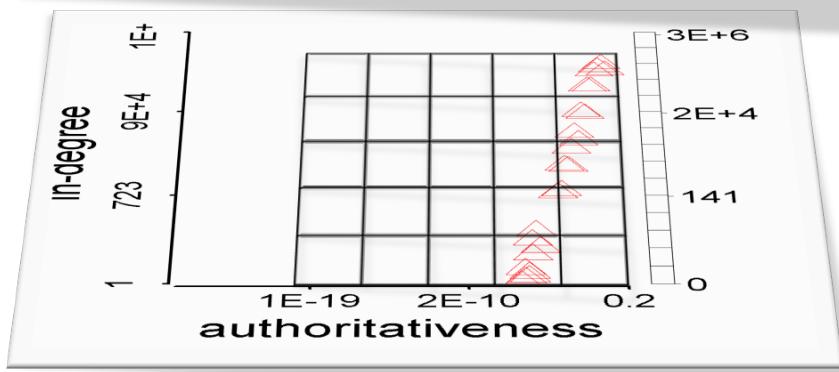

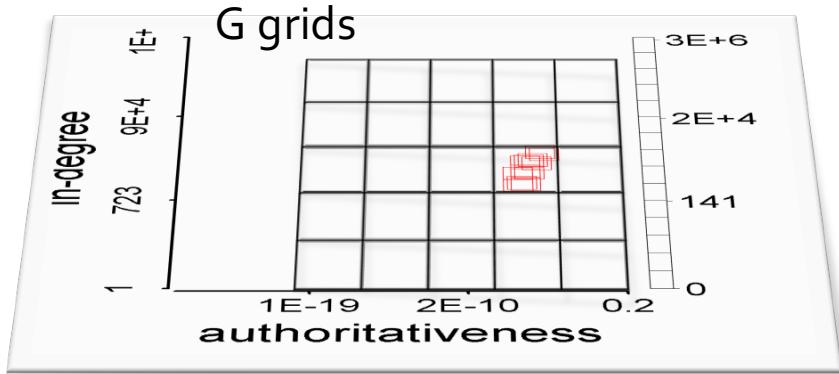

where

$$\sum f_g = 1, \sum b_g = 1$$

$bp_g$ : #background points in grid g  
 $\sum bp_g = B = N$  (#all users)

# Proof

**Lagrange multiplier:**

$$\text{minimize } s(f_g) = \sum f_g^2$$

$$\text{subject to } \sum f_g = 1, \sum f_g b_g = n$$

**Lagrange function:**

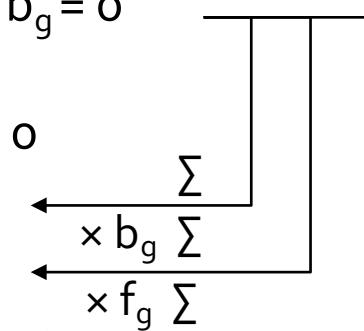

$$F(f_g, \lambda, \mu) = (\sum f_g^2) + \lambda (\sum f_g - 1) + \mu (\sum f_g b_g - n)$$

**Gradients:**

$$\left\{ \begin{array}{l} \nabla_{f_g} F = 2 f_g + \lambda + \mu b_g = 0 \\ \nabla_{\lambda} F = \sum f_g - 1 = 0 \\ \nabla_{\mu} F = \sum f_g b_g - n = 0 \end{array} \right.$$

$$\left\{ \begin{array}{l} 2 + \lambda G + \mu = 0 \\ 2 n + \lambda + \mu s_b = 0 \end{array} \right.$$

$$\left\{ \begin{array}{l} 2 s_{\min} + \lambda + \mu n = 0 \\ \sum b_g \sum \\ \times b_g \sum \\ \times f_g \sum \end{array} \right.$$

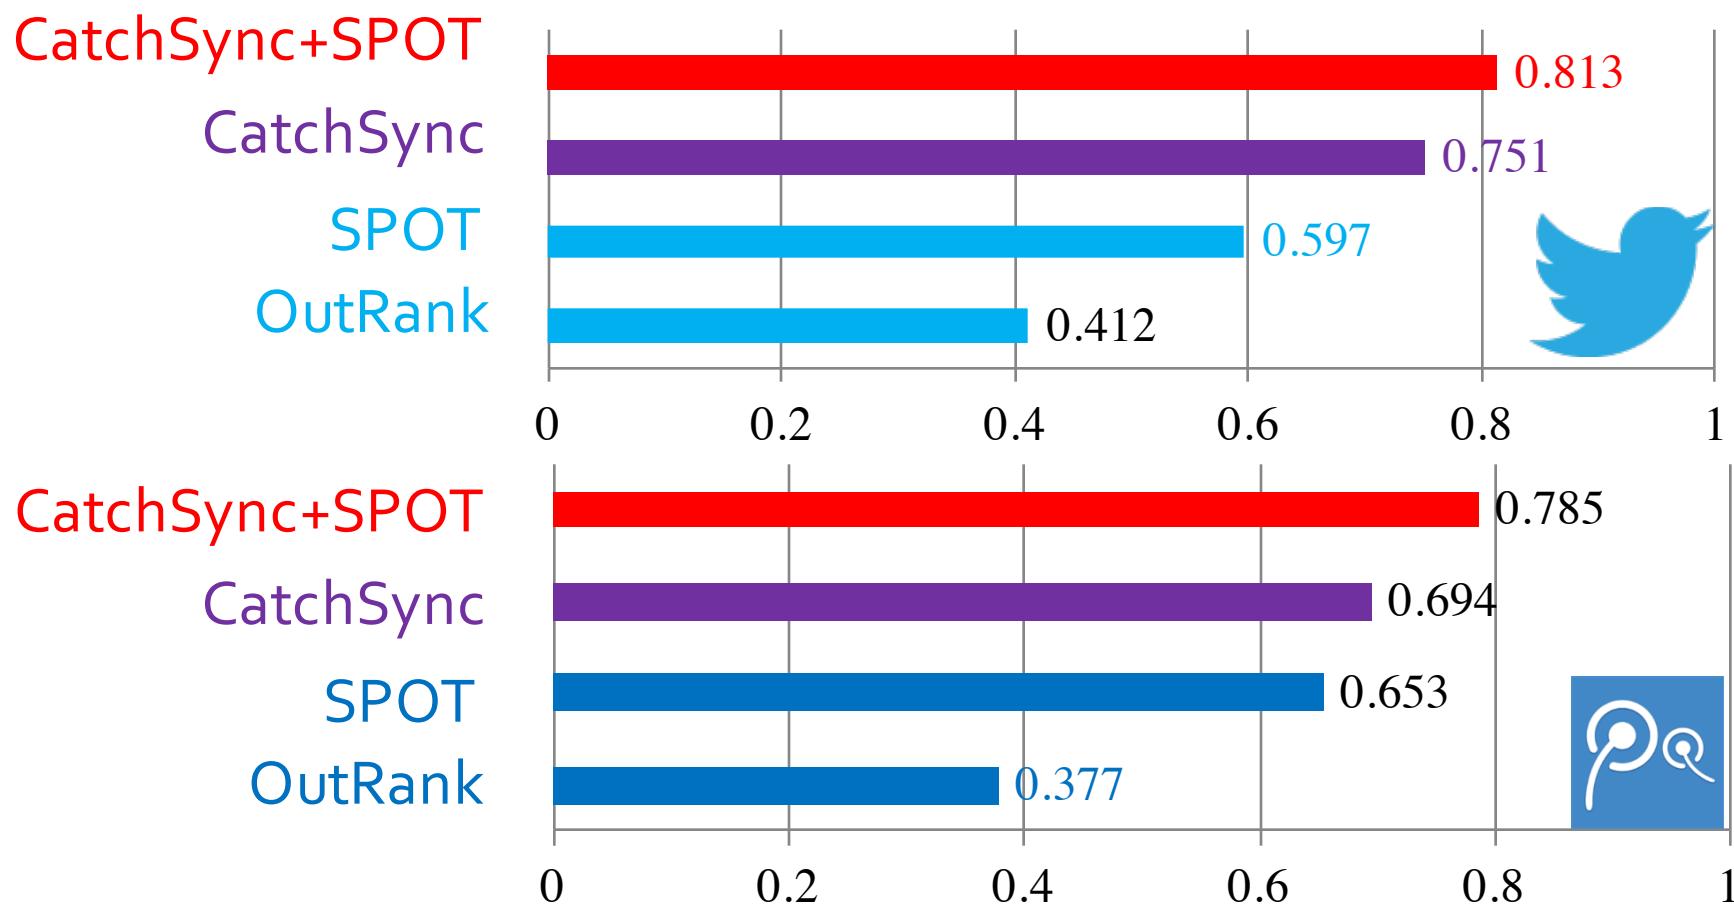

$$\text{where } s_b = \sum b_g^2.$$

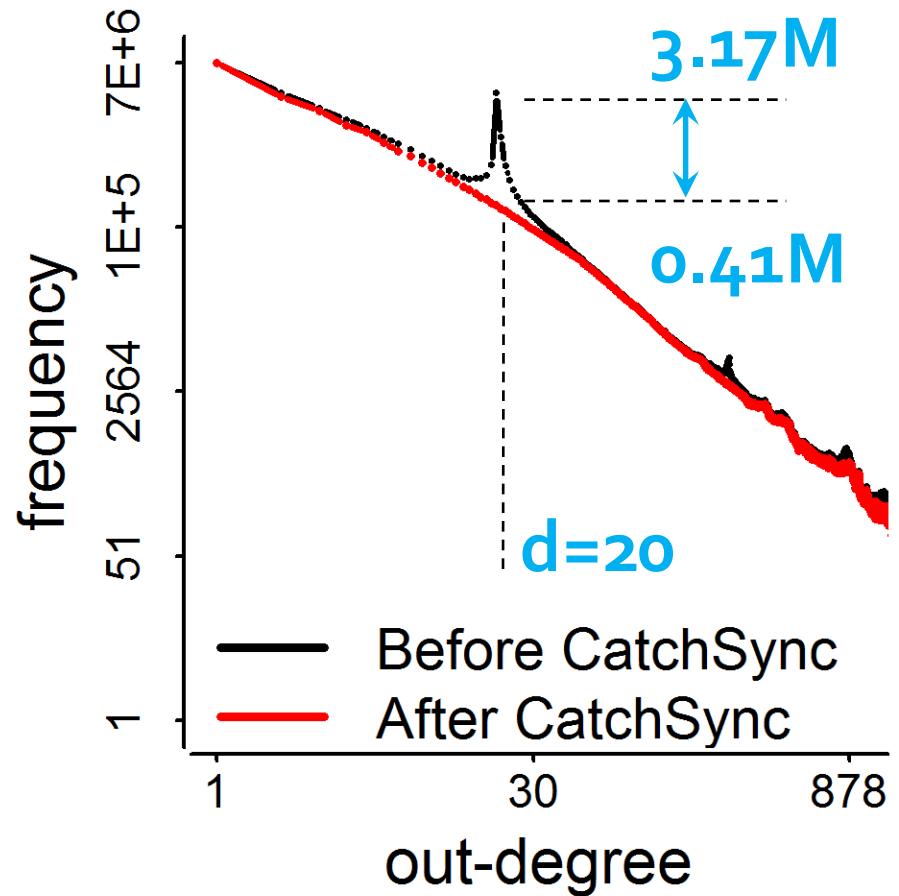

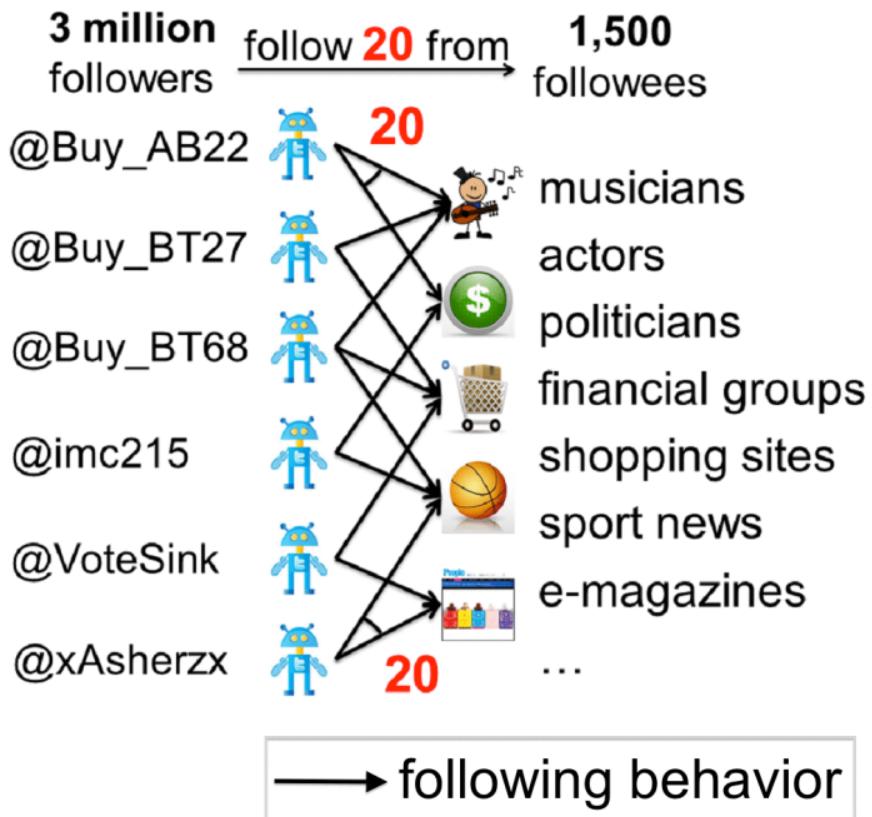

Therefore,

$$s_{\min} = \frac{-G n^2 + 2 n - s_b}{1 - G s_b}$$

# Accuracy: Complementary with Content-based Methods (SPOT)

# The Distribution was Recovered!

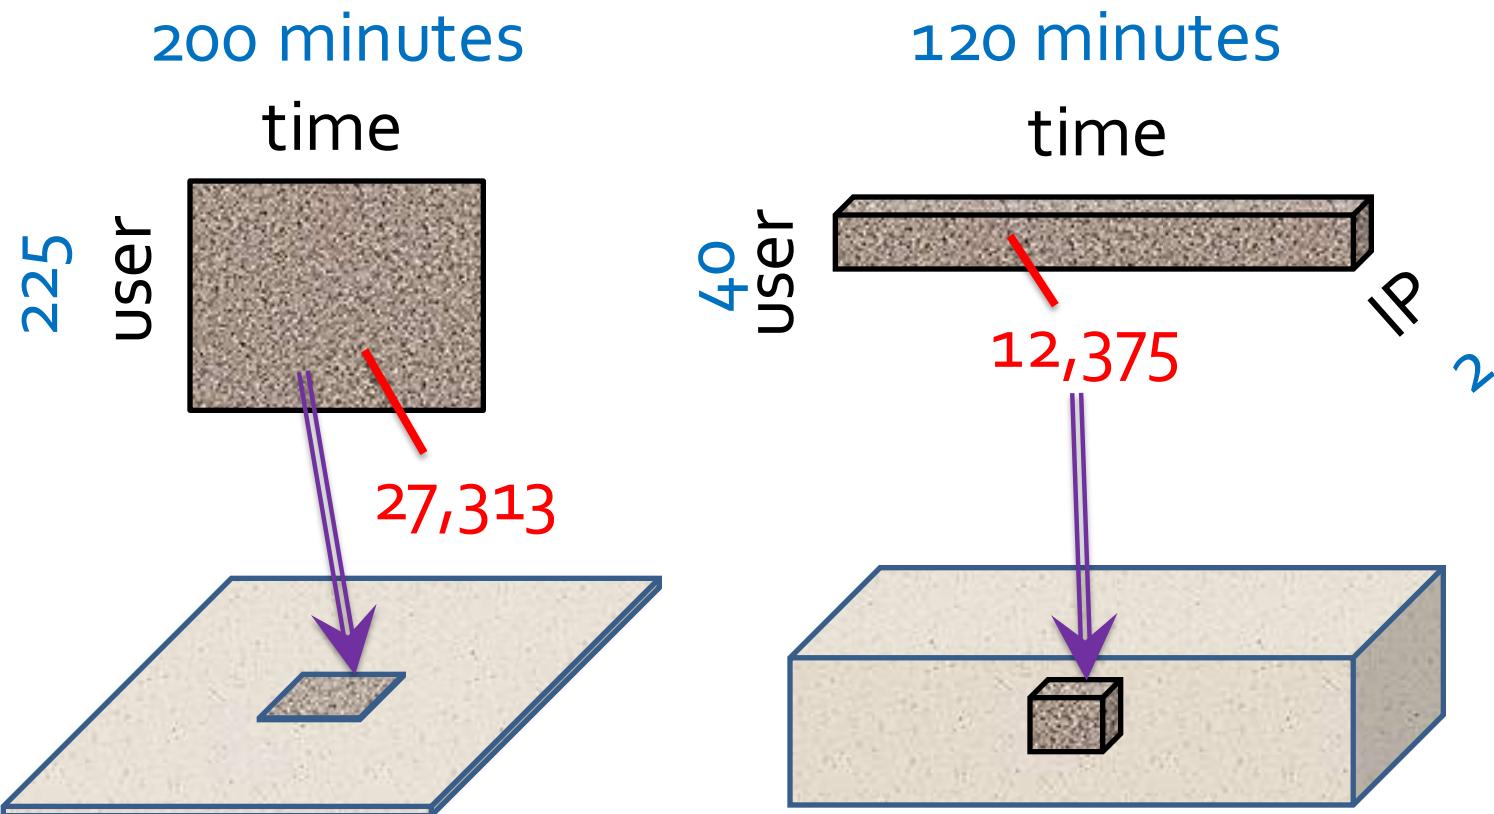

# 3. Social Spam

- **Problem definition:** Given **multidimensional behavioral data of spatiotemporal contexts**, find suspicious behaviors.

Dataset	Dimension/Mode				Mass
Weibo's Retweeting	User	Root ID	IP	Time (min)	#retweet
	29.5M	19.8M	27.8M	56.9K	211.7M
Weibo's Trending (Hashtag)	User	Hashtag	IP	Time (min)	#tweet
	81.2M	1.6M	47.7M	56.9K	276.9M
Network attacks (LBNL)	Src-IP	Dest-IP	Port	Time (sec)	#packet
	2,345	2,355	6,055	3,610	230,836

# Suspiciousness in Multi-dimensional Data

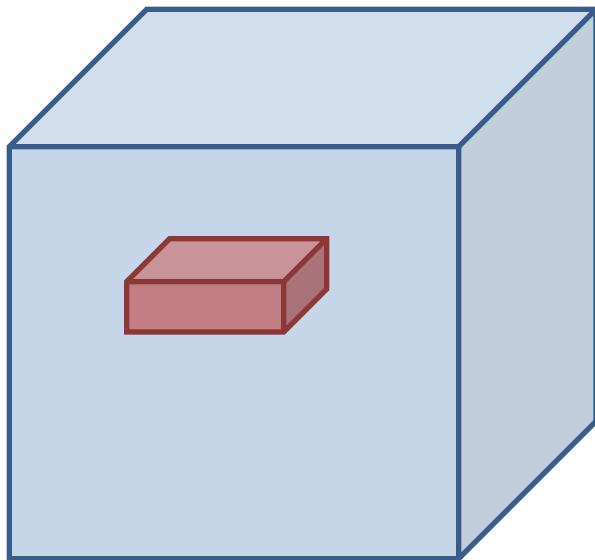

Q: Which is more suspicious?

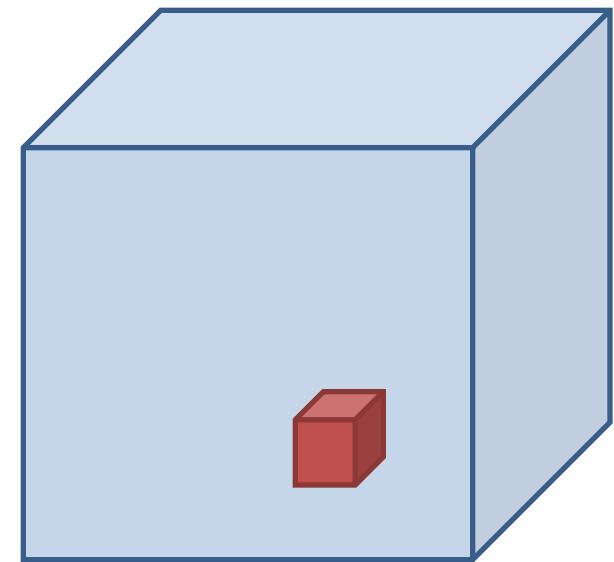

We need a metric to evaluate the suspiciousness.

# Criteria for Suspiciousness Metric

What properties are required of a good metric?

$N_1 \times N_2 \times N_3$   
Count data with  
total “mass”  $C$

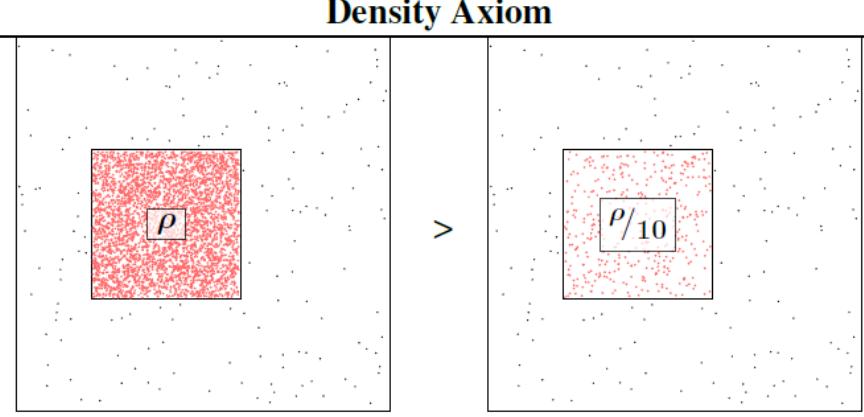

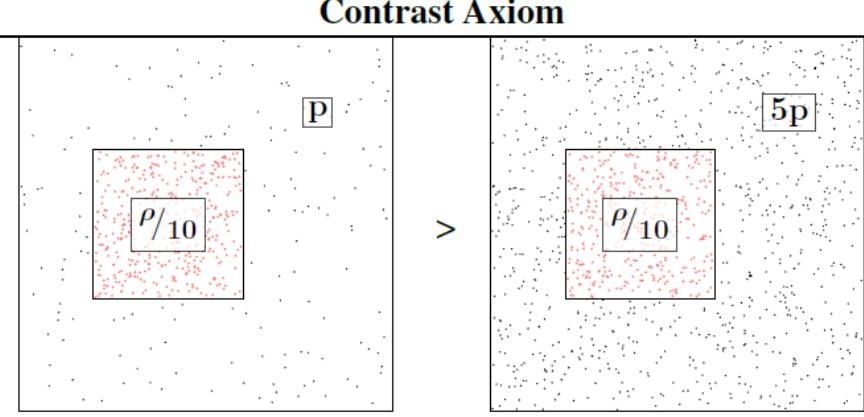

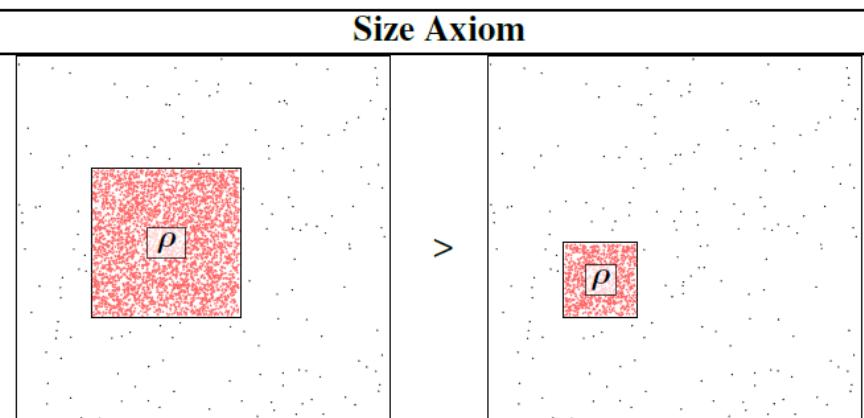

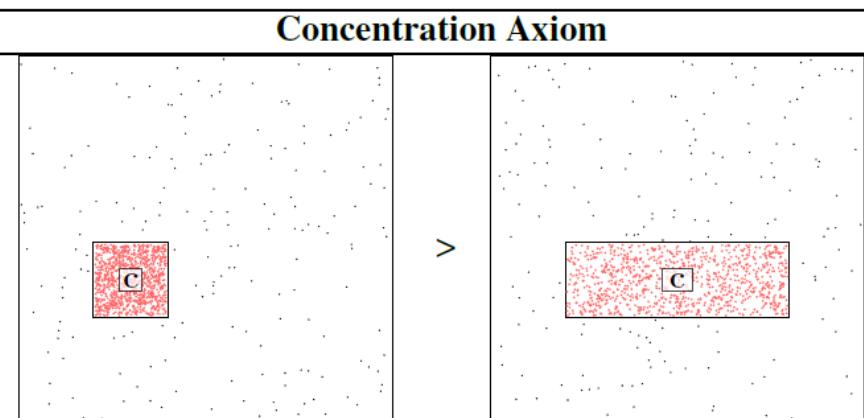

$$f( \begin{array}{c} n_1 \times n_2 \times n_3 \\ \text{mass } c \\ \text{density } \rho \end{array} )$$

vs

$$f( \begin{array}{c} n'_1 \times n'_2 \times n'_3 \\ \text{mass } c' \\ \text{density } \rho' \end{array} )$$

# Axioms: 1 to 4

$$c_1 > c_2 \iff f(\mathbf{n}, c_1, \mathbf{N}, C) > f(\mathbf{n}, c_2, \mathbf{N}, C)$$

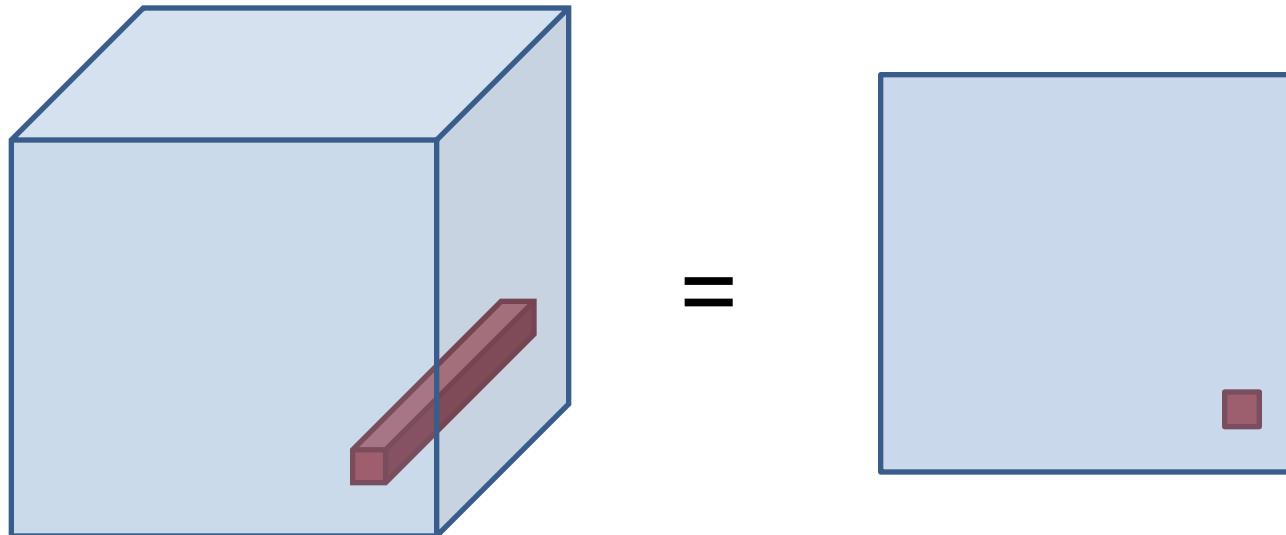

Density Axiom	Contrast Axiom
	
Size Axiom	Concentration Axiom
	

$$p_1 < p_2 \iff \hat{f}(\mathbf{n}, \rho, \mathbf{N}, p_1) > \hat{f}(\mathbf{n}, \rho, \mathbf{N}, p_2)$$

# Axiom 5: Cross Dimensions

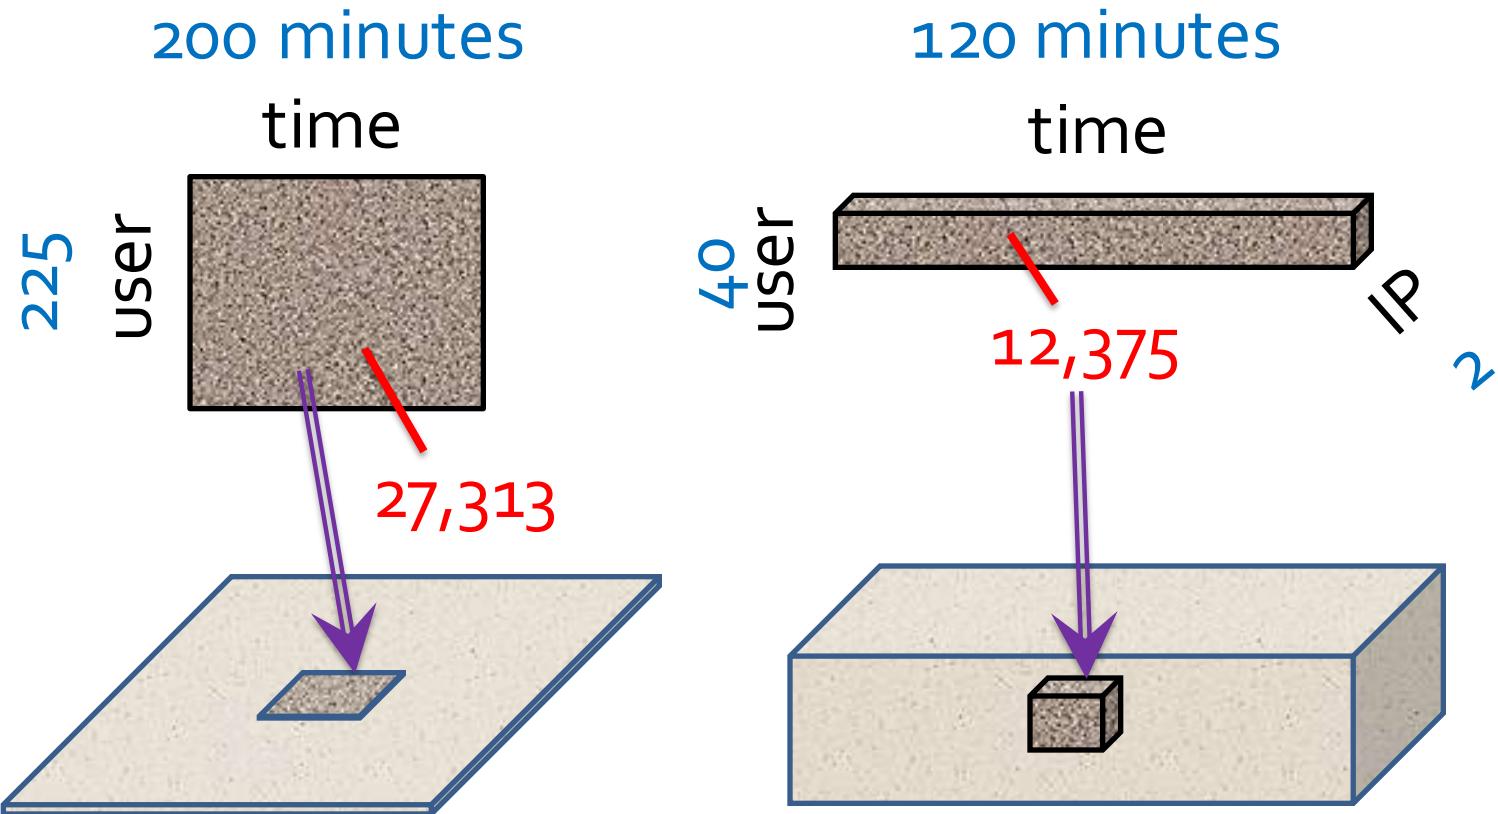

$$f_{K-1} \left( [n_k]_{k=1}^{K-1}, c, [N_k]_{k=1}^{K-1}, C \right) = f_K \left( ([n_k]_{k=1}^{K-1}, N_K), c, [N_k]_{k=1}^K, C \right)$$

Not including a mode is the same as including all values for that mode.

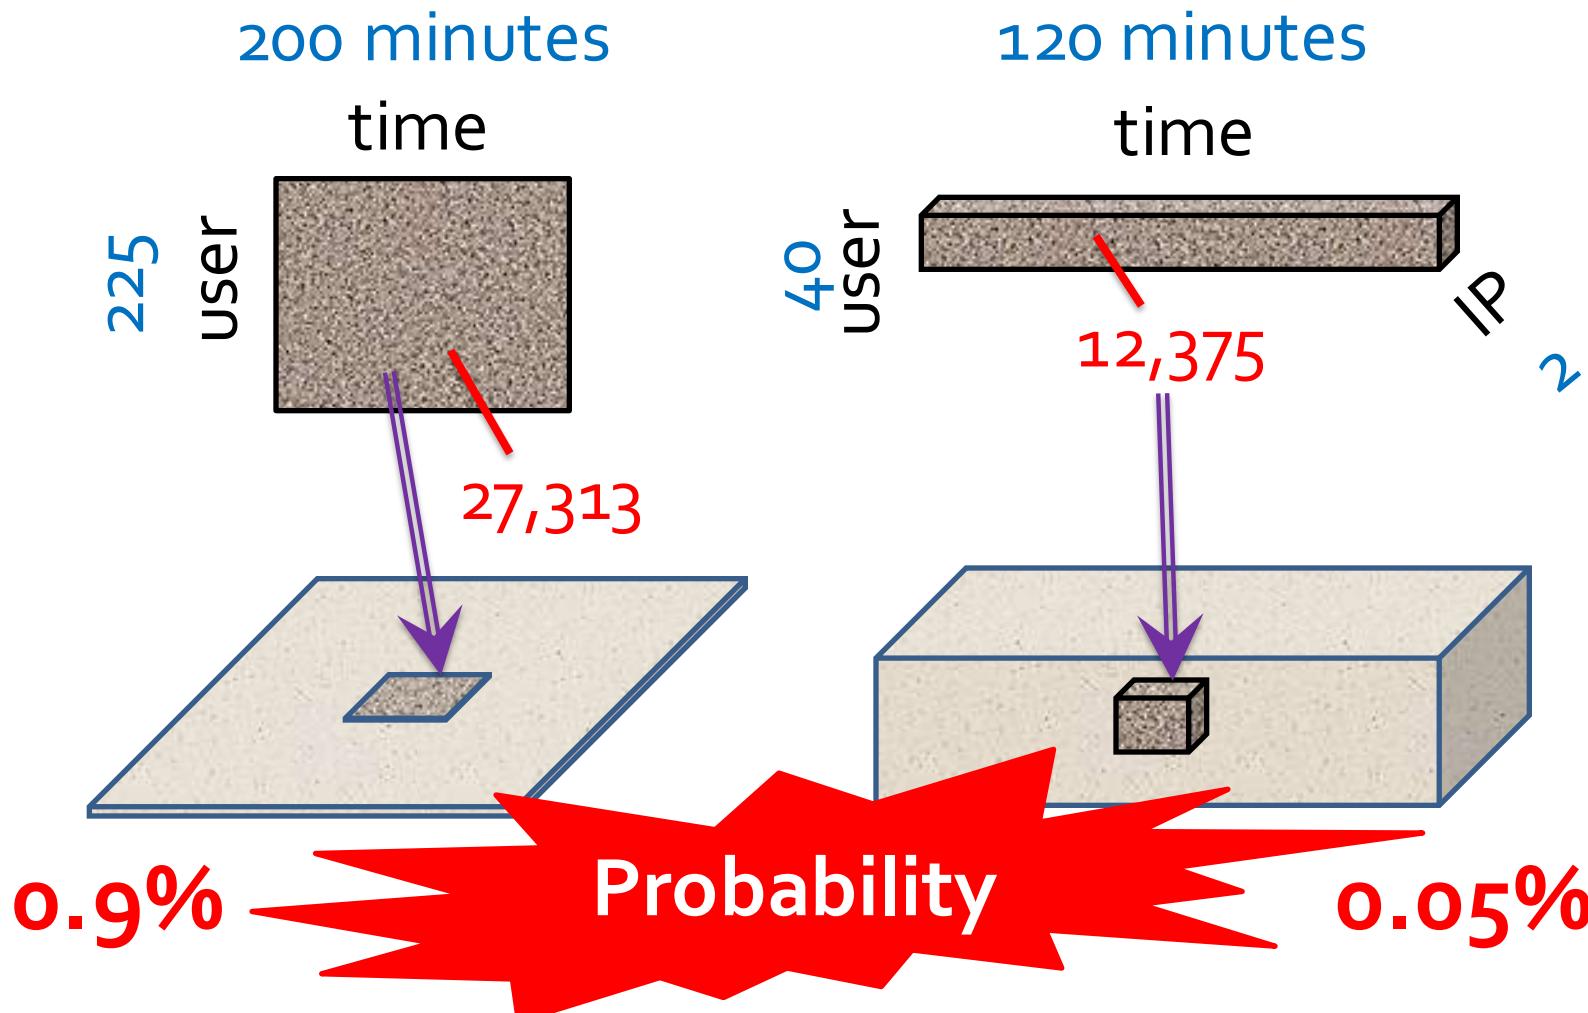

- ▶ New information (more modes) can only make our blocks more suspicious

# Scoring Suspiciousness

Q: Which is more suspicious?

# Scoring Suspiciousness

# A General Suspiciousness Metric

- Negative log likelihood of block's probability

$$f(n, c, N, C) = -\log [Pr(Y_n = c)]$$

**Lemma** Given an  $n_1 \times \cdots \times n_K$  block of mass  $c$  in  $N_1 \times \cdots \times N_K$  data of total mass  $C$ , the suspiciousness function is

$$f(\mathbf{n}, c, \mathbf{N}, C) = c \left( \log \frac{c}{C} - 1 \right) + C \prod_{i=1}^K \frac{n_i}{N_i} - c \sum_{i=1}^K \log \frac{n_i}{N_i}$$

Using  $\rho$  as the block's density and  $p$  is the data's density, we have the simpler formulation

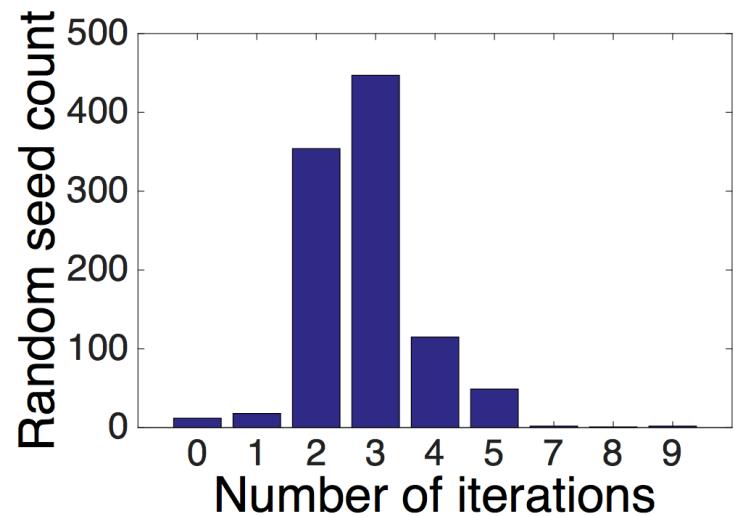

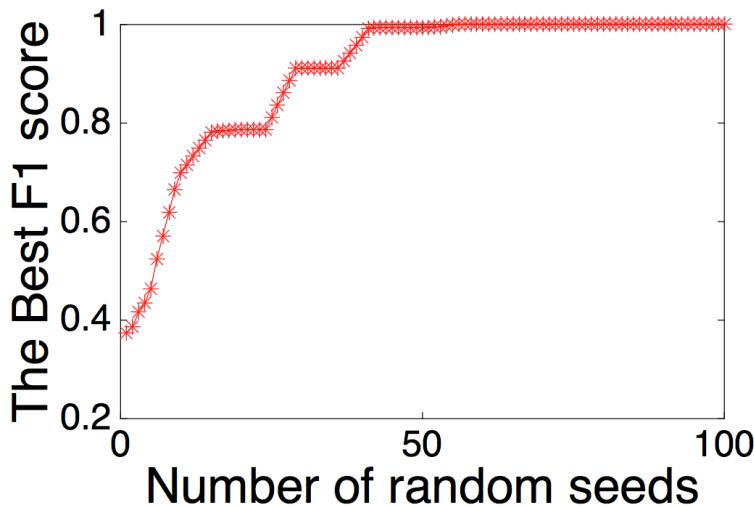

$$\hat{f}(\mathbf{n}, \rho, \mathbf{N}, p) = \left( \prod_{i=1}^K n_i \right) D_{KL}(\rho || p)$$

# Advantages

Visited CMU in 2012-13

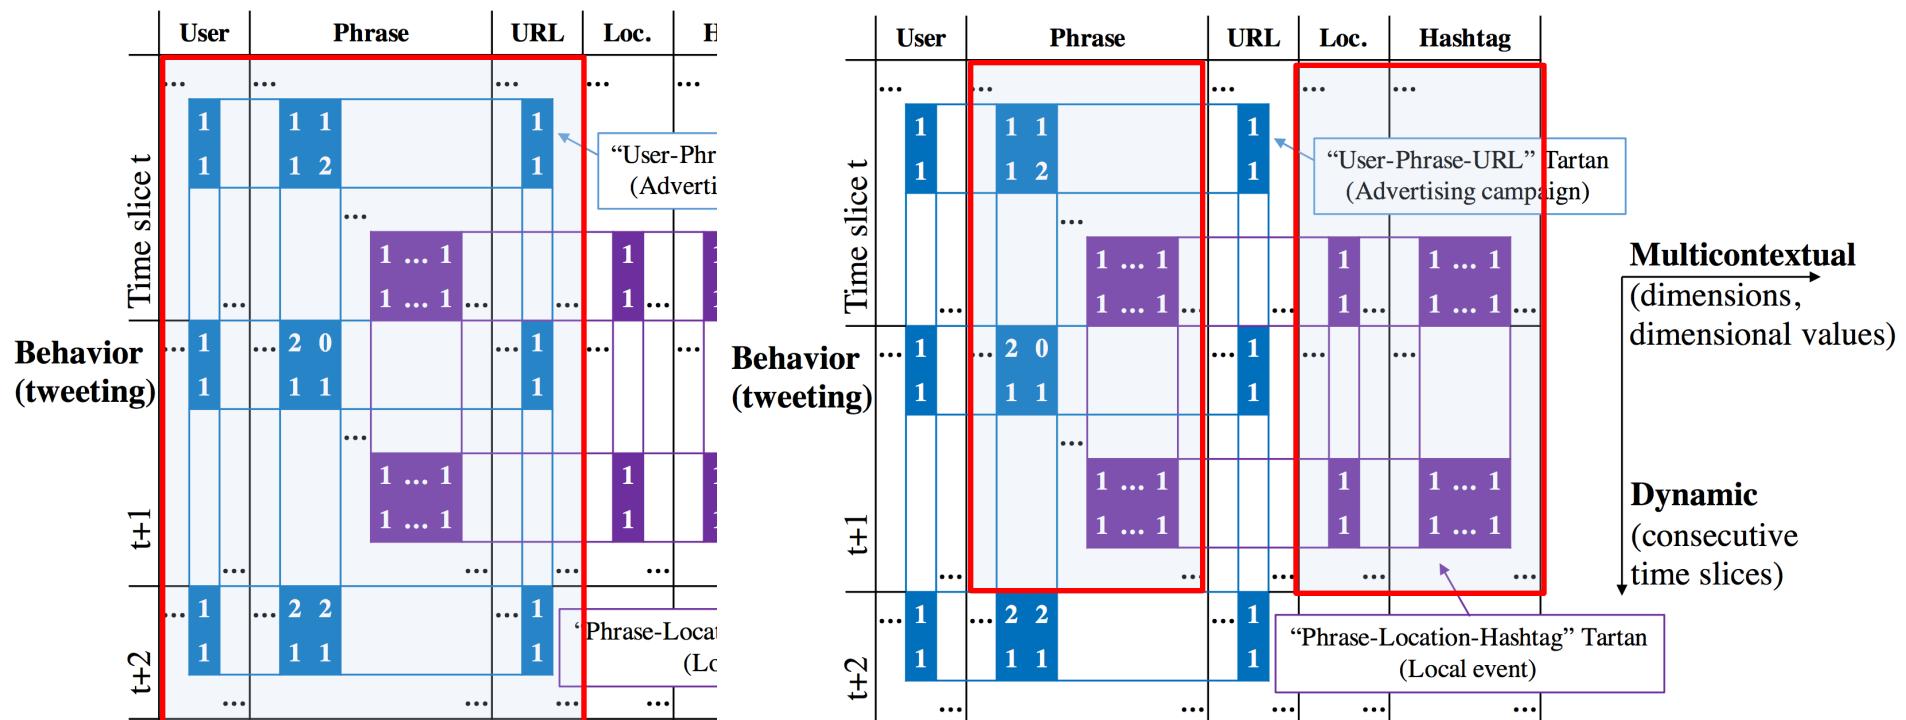

Watched lots of  
Tartans' games...

# Objective Function to Maximize (Minimum Description Length principle)

$$f(\mathcal{A}, \mathcal{X}) = L(\mathcal{X}^{\mathcal{A}}) - L(\mathcal{A}) - L(\mathcal{X}^{\mathcal{A}} \setminus \mathcal{A}).$$

Tartan Data First-level matrix Individual entries

$$\mathcal{X}^{\mathcal{A}} = \{\mathcal{X}_d^{(t)}(b, i) | d \in \mathcal{D}, t \in \mathcal{T}, i \in \{1, \dots, N_d\}, b \in \{1, \dots, E^{(t)}\}\}.$$

# Objective Function to Maximize (cont.)

$$f(\mathcal{A}, \mathcal{X}) = L(\mathcal{X}^{\mathcal{A}}) - L(\mathcal{A}) - L(\mathcal{X}^{\mathcal{A}} \setminus \mathcal{A}).$$

$$V = (\sum_{d \in \mathcal{D}} N_d) (\sum_{t \in \mathcal{T}} E^{(t)}).$$

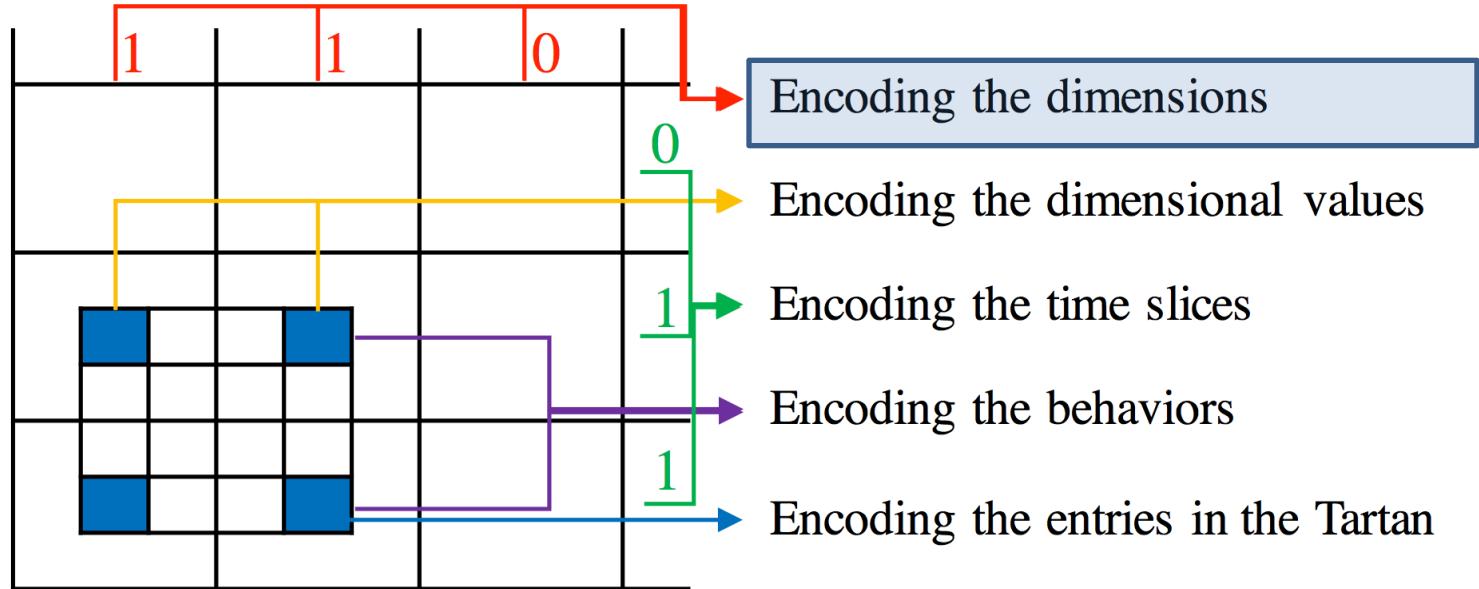

$$C = \sum_{d \in \mathcal{D}, t \in \mathcal{T}} \sum_{b \in \{1, \dots, E^{(t)}\}, i \in \{1, \dots, N_d\}} \mathcal{X}_d^{(t)}(b, i).$$

$$\begin{aligned} L(\mathcal{X}^{\mathcal{A}}) &= g(V + C, C) + L_{\mathcal{D}}(\mathcal{A}) + L_{\mathcal{T}}(\mathcal{A}) \\ &\quad + \sum_{d \in \mathcal{D}} \log^* N_d + \sum_{t \in \mathcal{T}} \log^* E^{(t)}. \end{aligned}$$

$$L(\mathcal{A}) = L_{\mathcal{D}}(\mathcal{A}) + L_{\mathcal{V}}(\mathcal{A}) + L_{\mathcal{T}}(\mathcal{A}) + L_{\mathcal{B}}(\mathcal{A}) + L_{\mathcal{A}}(\mathcal{A}).$$

$$L(\mathcal{X}^{\mathcal{A}} \setminus \mathcal{A}) = g(V + C - v - c, C - c);$$

# Encoding the Tartan: Dimensions

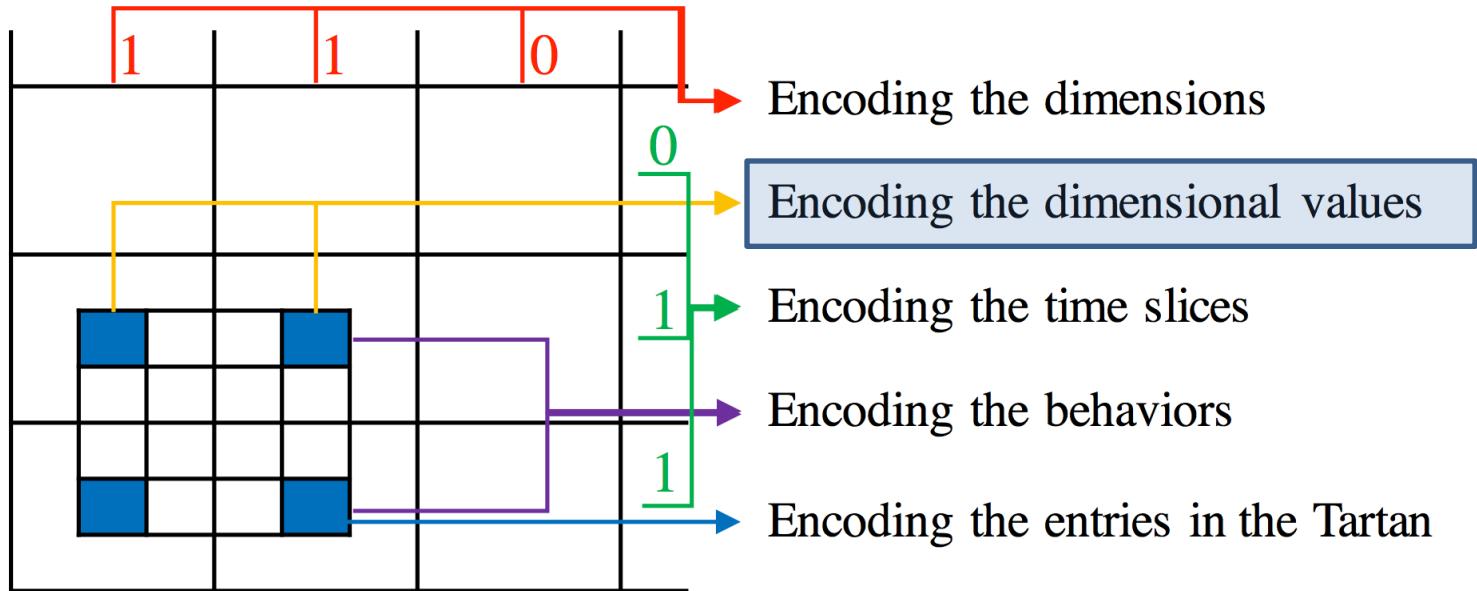

$$H_{\mathcal{D}}(X) = - \sum_{x \in \{0,1\}} P(X = x) \log P(X = x)$$

$$= - \left( \frac{D^{\mathcal{A}}}{D} \log \frac{D^{\mathcal{A}}}{D} + \frac{D-D^{\mathcal{A}}}{D} \log \frac{D-D^{\mathcal{A}}}{D} \right).$$

$$\begin{aligned} L_{\mathcal{D}}(\mathcal{A}) &= \log^* D + \log^* D^{\mathcal{A}} + D \cdot H_{\mathcal{D}}(X) \\ &= \log^* D + \log^* D^{\mathcal{A}} + g(D, D^{\mathcal{A}}), \end{aligned}$$

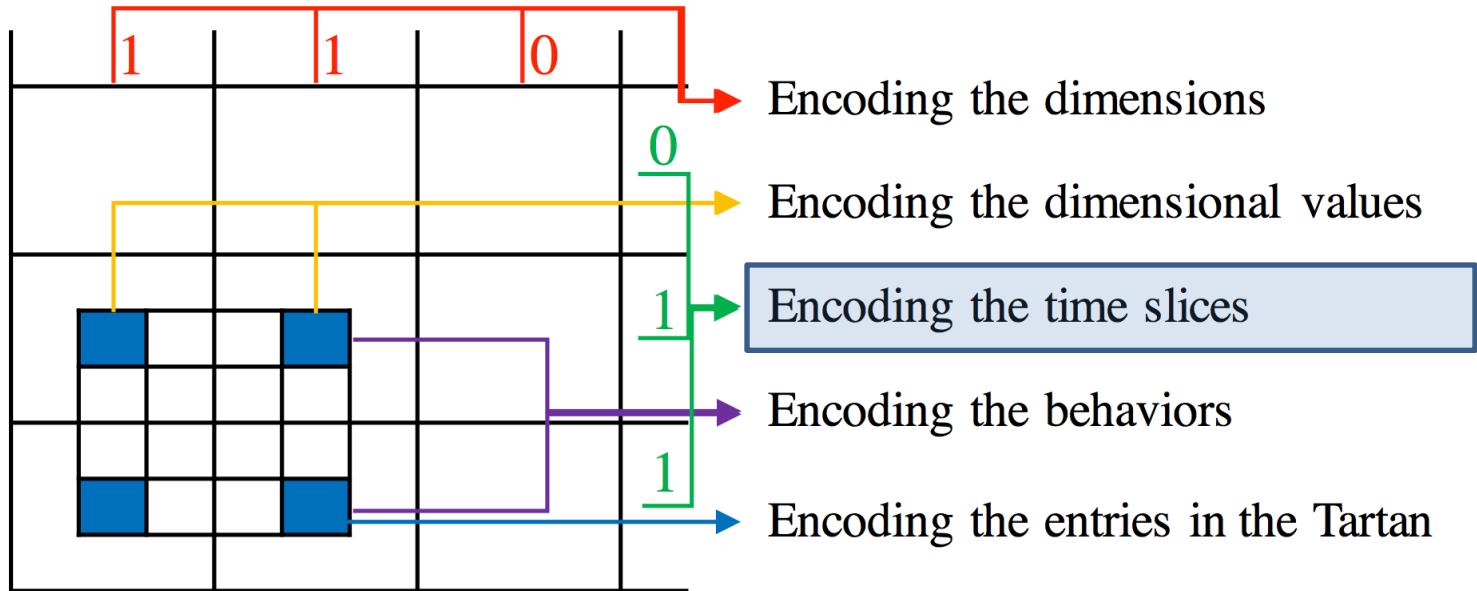

# Encoding the Tartan: Dimensional Values

$$H_{\mathcal{V}_d}(X) = - \left( \frac{n_d}{N_d} \log \frac{n_d}{N_d} + \frac{N_d - n_d}{N_d} \log \frac{N_d - n_d}{N_d} \right).$$

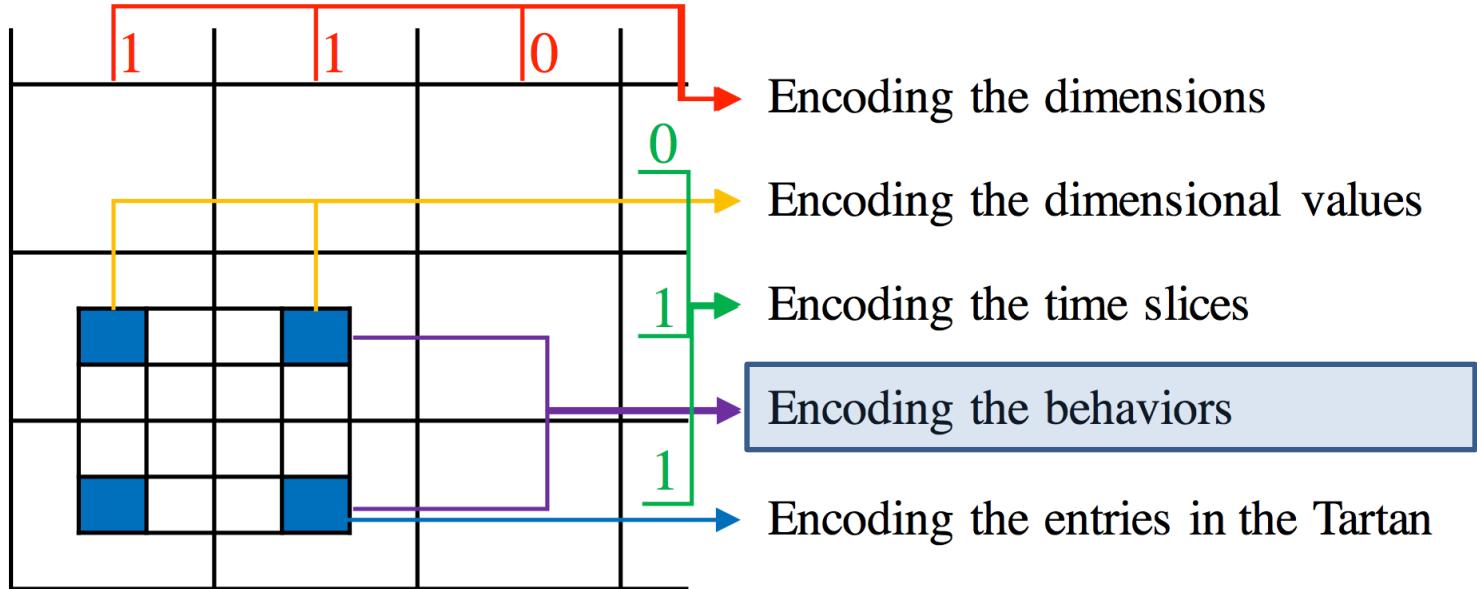

$$L_{\mathcal{V}}(\mathcal{A}) = \sum_{d \in \mathcal{D}} \left( \log^* N_d + \log^* n_d + g(N_d, n_d) \right).$$

# Encoding the Tartan: Time Slices

$$L_{\mathcal{T}}(\mathcal{A}) = \log^* T + \log^* T^{\mathcal{A}} + \log^* t_{start}$$

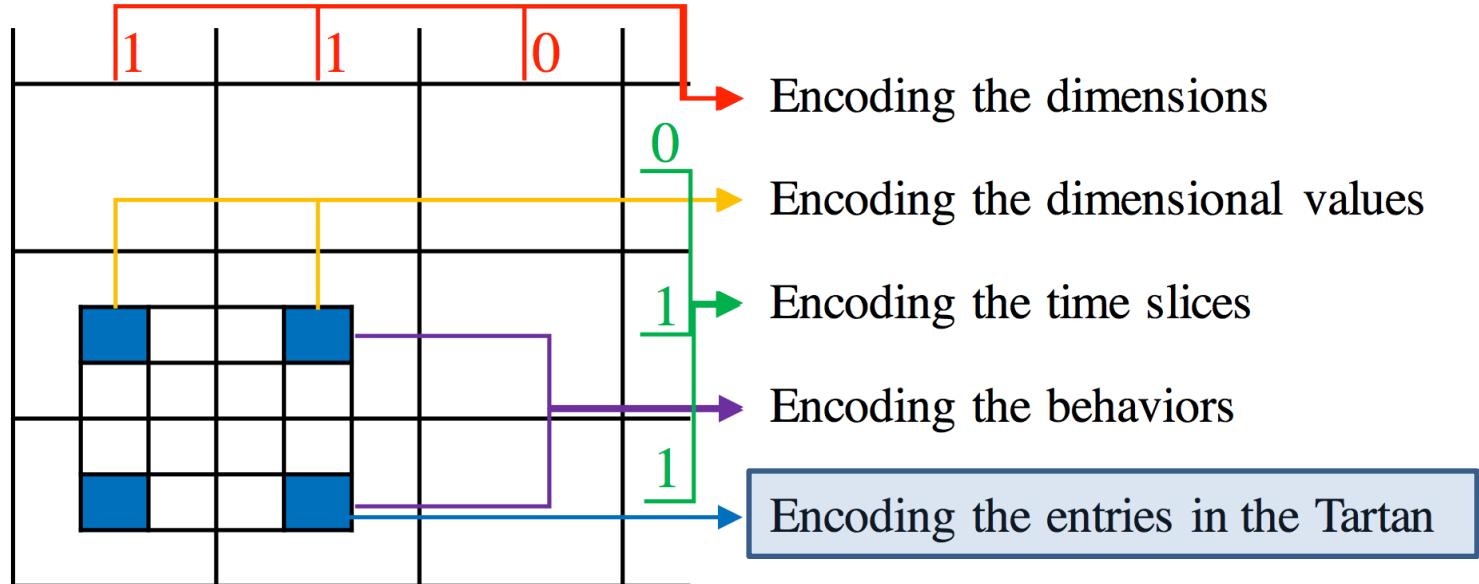

# Encoding the Tartan: Behaviors

$$H_{\mathcal{B}^{(t)}}(X) = - \left( \frac{e^{(t)}}{E^{(t)}} \log \frac{e^{(t)}}{E^{(t)}} + \frac{E^{(t)} - e^{(t)}}{E^{(t)}} \log \frac{E^{(t)} - e^{(t)}}{E^{(t)}} \right).$$

$$L_{\mathcal{B}}(\mathcal{A}) = \sum_{t \in \mathcal{T}} \left( \log^* E^{(t)} + \log^* e^{(t)} + g(E^{(t)}, e^{(t)}) \right).$$

# Encoding the Tartan: Entries

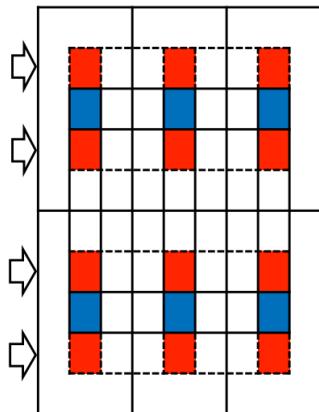

$$v = (\sum_{d \in \mathcal{D}} n_d) (\sum_{t \in \mathcal{T}} e^{(t)}).$$

$$c = \sum_{d \in \mathcal{D}, t \in \mathcal{T}} \sum_{b \in \mathcal{B}^{(t)}, i \in \mathcal{V}_d} \mathcal{X}_d^{(t)}(b, i).$$

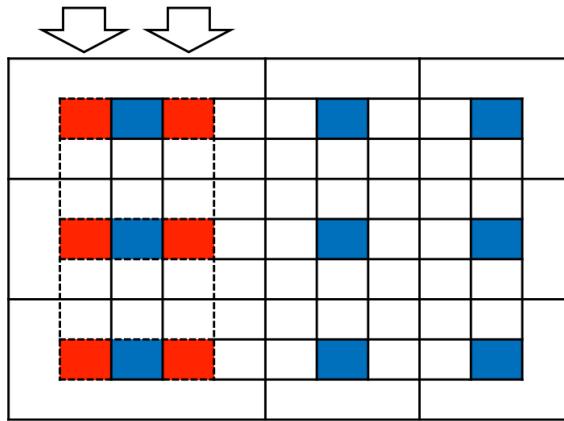

$$H_{\mathcal{A}}(X) = -\left(\frac{c}{v+c} \log \frac{c}{v+c} + \frac{v}{v+c} \log \frac{v}{v+c}\right).$$

$$L_{\mathcal{A}}(\mathcal{A}) = (v + c) H_{\mathcal{A}}(X) = g(v + c, c).$$

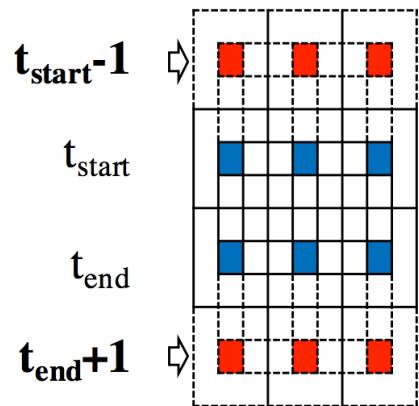

# Greedy Search for the Local Optimum

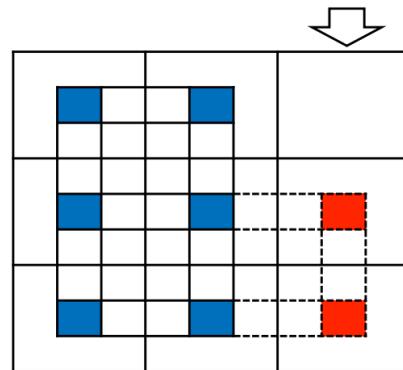

(a) Update the set of behaviors.

(b) Update the set of values.

(c) Update the consecutive time slices.

(d) Update the set of dimensions.

**Time complexity:**

$$\mathcal{O}(\sum_d N_d \log N_d + \sum_t E^{(t)} \log E^{(t)})$$

# Summary

- Density-based methods and applications
  - Density in temporal bipartite graphs
    - CopyCatch (WWW'13): Facebook, ill-gotten likes
  - Density (synchronicity) in large directed graphs
    - CatchSync (KDD'14): Twitter/Weibo, zombie followers
  - Density (suspiciousness) in multidimensional data
    - CrossSpot (TKDE'16): Twitter/Weibo, social spam
  - Density (MDL principle) in multicontextual data
    - CatchTartan (KDD'16): Twitter, events/campaigns
